SNAPSHOT PROBLEMS FOR THE EULER-POISSON-DARBOUX EQUATION

Tuesday, September 22, 2026
3:00 P.M. in Massry B008

ABSTRACT. Extending and reinterpreting work by Carlos Berenstein and collaborators on ball mean value operators, we explore the connection between snapshot problems for the Euler-Poisson-Darboux equation on Euclidean space and Liouville-type numbers related to the zeros of Bessel functions. Similar questions have been addressed for the wave equation on spheres and other manifolds. This is joint work with Fulton Gonzalez (Tufts University), Tomoyuki Kakehi (University of Tsukuba) and Jue Wang (North China Institute of Technology).
